

GROUND REFERENCED PIXEL RESET

By Matthew M. Borg

Abstract

A ground referenced pixel reset circuit is disclosed.

5 The ground referenced pixel reset circuit supplies a pixel
with a reset signal such that when the reset signal is
asserted high, the reset signal is at a ground referenced
reset voltage independent from a supply voltage. The pixel
includes a photosensor, such as a photodiode, that is
10 coupled to a ground having a same potential as the ground of
the reference voltage supply. In this manner, noise caused
by fluctuations in the supply voltage is reduced.
